

Making your business net zero

Mambu is a SaaS cloud banking platform that is challenging itself and the fintech sector to align the disruptive power of digital technology with sustainability. Since 2019, Mambu annually measures its GHG emissions across all three scopes based on the GHG Protocol and has set environmental impact reduction targets across every aspect of the business. They cover business travel, enterprise IT infrastructure and the cloud, procurement, events and marketing, office and home office, and commute. For example, they plan to pilot an internal carbon tax ahead of the upcoming EU sustainability reporting regulation, have adopted a hybrid working policy reducing employee commute and downsizing offices, and are working with cloud providers to assess energy efficiency and sustainability opportunities in how they use the cloud. For remaining unavoidable emissions, Mambu strives to compensate for these through local reforestation and conservation projects in line with public sector biodiversity and nature restoration plans. Mambu is an advocate for a socially, ethically, and environmentally responsible fintech industry and works with its value chain to develop systemic solutions to the sustainability transition.
